ScamShield | AgentReel A05

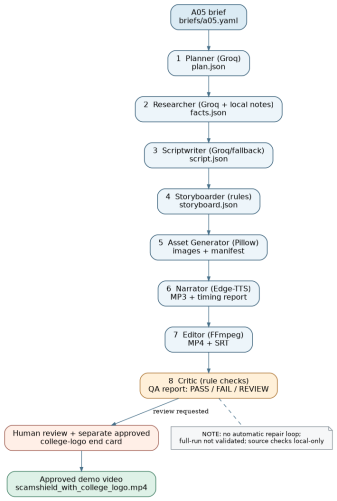

PROCESS REPORT — Pre-submission draft | LY Agentic AI Lab | 22 October 2026

1 Brief, audience and creative concept

ScamShield creates a ~53.26-second English vertical cyber-safety awareness reel for college students. It focuses on fictional fake-internship/job-fee solicitations and impersonation-based “digital arrest” threats. The seven-scene narrative moves from a hook and illustrative scenarios to “pause, verify, protect,” official reporting, and an AI-disclosed college-branded end card. The scenario does **not** claim every fee-charging internship is fraudulent.

2 Architecture and tool choices

Planner (Groq) produces *plan.json*; **Researcher** (Groq over curated local official-source notes) produces *facts.json*; **Scriptwriter** (Groq/fallback) writes scene JSON; **Storyboarder** maps seven shots by rules; **Asset Generator** draws 1080×1920 programmatic Pillow visuals; **Narrator** creates Edge-TTS voice clips; **Editor** assembles H.264/AAC video and SRT with FFmpeg; **Critic** reports automated technical checks and manual REVIEW items. Custom Python orchestrator supports check, QA and experimental full modes.

3 Grounding, licensing and responsible AI

The Researcher accepts quotations only when they exactly match curated source notes and retains source IDs. This proves **local-note matching, not independent verification** of government websites or PDFs. Publishing still requires original-source review. The reporting message distinguishes the official cybercrime portal (cybercrime.gov.in) from **1930 for financial cyber fraud**. Fictional UI and abstract imagery avoid depicting real victims; generated visuals are rule-based, not diffusion-model images. The approved end-card logo was added through a separate human-reviewed edit, not the current main Editor code.

Results, evaluation and limitations

Pre-submission evidence summary — do not treat open reviews as passed

4 Video result and Critic findings

Specification / evaluation	Observed
Runtime, image	53.261 s; 1080×1920; 25 fps
Video / audio	H.264 High, yuv420p; AAC, 48 kHz stereo
Size; subtitle track	~1.54 MB; 13 SRT cues
Critic summary	14 PASS | 1 FAIL | 10 REVIEW
Audio loudness / peak	–21.0 LUFS (target ~–14); –7.7 dBFS true peak

The approved reel and tightened scene pacing were visually accepted by the student. The measured loudness deviation is intentionally retained, **not reclassified as PASS**. SRT cue bounds and overlaps passed; exact speech alignment, official-logo authorization, full original-source verification, safe zones and mandatory Category A human sign-off remain documented review items. A decorative scene header enters the top 250-pixel platform exclusion zone.

5 Orchestration, autonomy and Critic loop

Tested: *run.py --mode check* confirmed required final artifacts; *--mode qa* executed Critic and recorded its FAIL/REVIEW outcome. A separate-copy full run passed Planner (2.002 s) and Researcher (5.622 s), then Scriptwriter stopped on missing required topic-category identifiers. A follow-on compatibility patch in the disposable test folder produced an indentation error and was not moved to the primary project. Consequently the complete generation pipeline has **not** passed an end-to-end integration run and no automatic Critic-to-agent repair loop exists. It is misleading to claim L3/L4 full autonomy.

6 Logging, cost discipline and human involvement

Stage outputs and some token counts appear in existing logs, but a complete authenticated cost reconciliation is unavailable. Historical unknown cost must be labelled **not recorded**, not zero. Human involvement includes script revisions, pacing/scene-layout adjustments, final logo integration, acceptance of the loudness limitation and editorial approval. Exact retrospective intervention counts/timestamps are not verifiably instrumented and should be declared as such.

7 Submission remaining

Complete original-source checks, authorized-logo/licence manifest, a factual REVIEW sign-off, actual logs/cost inventory, prompt templates, final team-ID filenames and repository QA. The written specification requests a one-command workflow and feedback loop, but faculty reportedly permits demonstrating a previously produced reel; the written-brief deviations must remain explicit. Tag **v1.0-final** only after deliverable review.
